

PROJECT

You 're tasked with creating data storage solutions using Amazon EBS and EFS for different use cases.

Guidelines/Goals:

1. Amazon EBS Setup:

- Create an Amazon EBS volume and attach it to an EC2 instance.
- Format and mount the volume to a specific directory

2. Use EBS for application Data:

- Create a simple text file on the EBS volume
- Ensure the data persists even if the instance is stopped and started

3. Amazon EFS setup:

- Create an amazon EFS file system
- Mount the file system on multiple instances

4. Use EFS for shared Data:

- Create a file on one instance and verify its presence on another
- Observe how changes to the file on one instance are reflected on the other.
